

EIDERS AND CHOLERA

Studies continued on how avian cholera affects survival and reproduction of eider ducks and herring gulls nesting in northern Hudson Bay

ARCTIC TERNS ΔΓ'dCΔc'

TRACKING MURRES ¹b▷≥५°C▷σ°°C° ⊲⁰<Δ°

Biologists tracking murres with tiny recorders have found that birds remain in the Arctic longer than expected before heading to the North Atlantic for the winter

ROSS'S GULLS AND IVORY GULLS

Two new colonies of Ross's gulls and two new colonies of Ivory Gulls were found near Bathurst Island

L'\(\frac{1}{2}\)^\tilde of \(\rac{1}{2}\)^\tilde of \(\rac{1}2\)^\tilde of \(\rac{1}2\)^\tilde of \(\rac{1}2\)^\tilde of

Research continues to track snow buntings migrating from Southampton Island over the winter to understand how climate affects breeding and survival

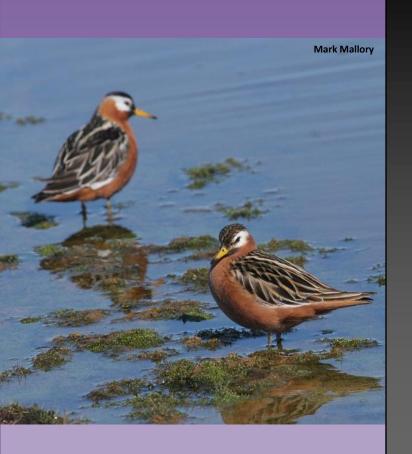

Working with Inuit partners, coastal surveys in Hudson Strait showed that polar bears are eating eggs at many eider colonies

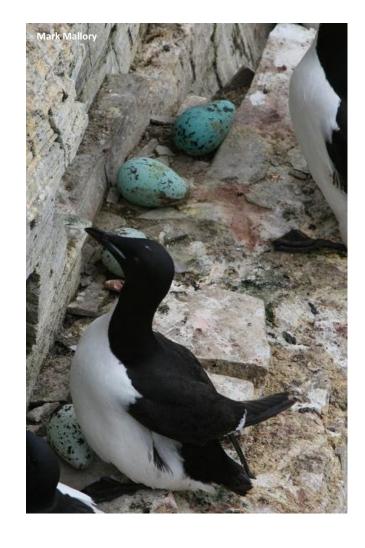

EIDERS AND POLAR BEARS

SHOREBIRD STUDIES

Shorebird migration and the effects of snow cover on timing of breeding were examined

CONTAMINANTS

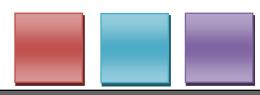

Eggs from murres and fulmars were sampled at Prince Leopold Island, where monitoring shows ongoing increases in mercury

Successful tracking of these lovely birds from the High Arctic showed that most moved west to the Pacific Ocean for the winter

SNOW GEESE

ROSS'S GEESE

Collaborative research in 2011 was undertaken or supported by personnel at the following institutions

Canada

Support for field programs was provided by the Government of Canada (Environment Canada – S&T, CWS, IFRA; Natural Resources Canada – PCSP; NSERC; Aboriginal Affairs and Northern Development Canada - NCP, NGMP), ArcticNet, and the Nunavut Wildlife Management Board. All work was undertaken with appropriate animal care, land use, wildlife and scientific permits from university, territorial and federal government departments and Inuit organizations.
